
EC MASTER DATA ANALYSING TOOL

MERCURY

Standard solution to evaluate, monitor and optimize
your Master Data in SAP System

Increase your master data quality to be ready for your next upgrade to S/4HANA or Cleaning your Data in a sustainable way.

Every company is facing in every digitalization transformation many challenges related to master data, especially with the upgrade of S/4HANA. Master data is playing a key role for a successful integration to all interfaces and migration project. This is not only a technical challenge but also a business opportunity to bring the data to a higher standard. A high quality of data will not be realised in one day or a week, this is a collaboration with a different business unit within the organization.

This is the reason data Clean Up project is a **Must** to prepare for the migration, our tool is guaranteed to be used in both systems S/4HANA and ECC. This will also support in a long term after the project and in ongoing business process.

MERCURY is your solution before and after S/4HANA Migration

MERCURY is the perfect S/4HANA project solution

With MERCURY you can prepare for your next upgrade to S/4HANA project without using too much effort, since the tool is providing you a high standard solution to check the data in real time. Analysing the data is the focus of the tool to monitor the actual status of the data. It will provide you all the answers on how to find your duplicate business partners (Vendors/Customers)? How to check all the activities related to BP? How to relate the general data to all organizational data?

MERCURY is not only focusing on showing the data, but it also provides you the solution to adapt, update fields, or mass change data without exit of the tool required.

It is a perfect solution to speed-up the process and business decision in such a complicated project.

Facts

Direct integration with SAP

Check all activities related to master data

EC MERCURY Master Data Tool Business Partner

With MERCURY we provide you the ultimate solution to make sure your data would be right away corrected with a simple click and with simple verification process without tool exit required. the duplicate check will provide you the last status of the data which vendors or customers that need to be deleted. A verification of the activity is applied for purchase orders, sales orders, payment data, this will support to take a decision to delete and to block a vendor/customer with automatic verification applied. you can always reverse the status of the supplier and the vendor if the decision was not finalized or wrong.

You can optimize with MERCURY big data volumes without using an excel or any third-party software. The business partner data is linked automatically with your last master data tables values.

- General data view for customer and vendor master data will give you full picture of the data quality
- Create your own rules applied in a company code and purchasing org levels, the tool will give you result of your data quality measurements.
- Create your own rules applied in company code and sales organizational levels, the tool will give you result of your data quality measurement
- Check all the transactional data and historical data without leaving the tool, only double click is required.

VAT check is also an option to validate and make sure information entered in SAP system is valid and reflect the actual status.

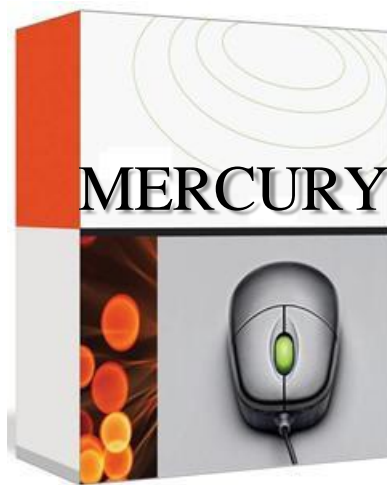

This is applied to vendor and customer master data, and it is working via an interface that check, provide a status, and validate the data.

There is two option possible after the result:

- Correct the data manually in case you have a correct information
- Contact the supplier by simple click to confirm the data
- Template is supported to simplify the process

This will also speedup the process in case a duplicate verification was not 100% assumed verification was

EC MERCURY Master Data Tool Material

- Basic Data check function works by checking the rules customized. The Correction is possible directly in the tool. Filter functionality offers you the possibility to limit the result by material types
- Sales View data can be corrected and verified separately with a combination of the material data description. The rules can be customized and implemented as per the organization standard
- Plant view data, storage data, Quality data can be also corrected, rules will be also applied based on the customized table
- Check all the transactional data and historical data without leaving the tool, Only a simple double click is required.

MERCURY tool is offering also duplicate check for material master data. Other than business partner data, rules are mostly different from organization to organization, therefore we aimed to make it generic.

The first step is to implement the rules applied by the company, secondly make sure the fields selected as key to identify the duplicate candidates.

Same as business partner, the decision to block or delete material master data is also related with open document, historical data and material activities that can be directly tracked via MERCURY.

Service Features and Benefits

TECHNICAL SUPPORT
